                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 (bases 1 to 24)
Vaughan, P.R., Galanis, M., Ramshaw, J.A.M. and Werkmeister, J.A.
Method for producing, in yeast, a hydroxylated triple helical
protein, and yeast host cells useful in said method
Patent: US 6451557-A 7 17-SEP-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ramshaw,J.A., Galanis,M., Vaughan,P.R. and Werkmeister,J.A. Stable expression of triple helical proteins

                                                                                                                                                                                                    The invention relates to purification and amplification of target nucleic acid from biological sample. The method involves and binding target nucleic acid (TRA) in the sample with a material comprising an unmodified silica surface, separating the material from the sample and amplifying TRA in the presence of the material. The method is useful in diagnosis of certain diseases such as inherited diseases like sickle cell anemia and certain types of cancer or in screening blood for presence of target nucleic acid from virus. The method improves reaction efficiency and detection sensitivity of target nucleic acids. The present sequence represents an internal control (IC)-specific probe used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= a

The invention relates to a method for amplification of a target nucleic acid region. The method is useful for amplification of a nucleic acid molecule using control nucleic acid sequences. The control nucleic acid sequences are at least in part parallel-complementary to the sequence of the target nucleic acid. The present sequence is $72535 probe used to the method of the invention. Note: This sequence is stated to be same as that shown as $EQ ID NO:4 in sequence listing. However this sequence has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amplification of a target nucleic acid region using control sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                     acid region in a sample using a specific control sequence. The invention is also directed to a method of determination of a target nucleic acid using a special control nucleic acid. Nucleic acids of the invention are used as a control in a reaction for amplifying target nucleic acids and nucleic acids. The present sequence is a probe used to illustrate the methods of the invention. Note: This sequence is stated to be same as additional T at its 3' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a

THE LITTLE LITTLE SECTION OF THE LITTLE LITT

```
The specification describes a composition of magnetic glass particles, which contain at least one magnetic object with a mean diameter between 5-500 nm. The composition is useful for the purification of nucleic acids. The composition can be used to process large quantities of nucleic acid samples, because it does not involve the particles being centrifuged or the fluids being drawn through glass fiber filters. The present sequence represents a probe which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                     ö

Detecting a change in length of an oligo:nucleotide with a light-emitting label - by measuring light emission in the presence of a DNA binding cpd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel Drosophila species DNA sequences and their encoded proteins with their corresponding human homologues. The proteins or their encoding polynucleotides are useful in a method of prevention, treatment or diagnosis of a disease in an individual, and used to
                                                                                                                                                                                  The present sequence is the oligonucleotide probe SK535, which is hexachlorofluorescein labelled, and used for the detection of an internaquantification standard (IQS). The amplification of the IQS is used to prep. a standard curve, to which the amplification of an unknown sample, which is detected using a fluorescein labelled probe, is compared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Drosophila polypeptides and polynuclectides, useful for diagnosing, preventing and/or treating disorders, such as cancer, glomerulonephritis, rheumatoid arthritis, psoriasis, malaria, emphysema and alopecia.
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; cytostatic; cardiovascular; immunosuppressive; nephrotropic; antirheumatic; antiarthritic; dermatological; antipsoriatic; antiinflammatory; fungicide; gene therapy; Drosophila; diagnosis; cardiovascular disorder; autoimmune disease; glomerulonephritis; rheumatoid arthritis; dermatological disorder; psoriaais; inflammatory disorder; malaria; emphysema; alopecia; primer.

the function of the polypeptide comprising incubating the polypeptide or modulating the function of the polypeptide comprising incubating the substance binds to the polypeptide. The compositions are administered to an individual in need of such treatment. The method of diagnosis, in which the presence or absence of a polynucleotide is detected in a biological sample, comprises brining the biological sample containing the nucleic acid such as DNA or RNA into contact with a probe comprising a fragment of at least 15 cm uncleotides of the polynucleotide, and detecting any duplex formed between the probe and nucleic acid in the sample. The method also comprises providing an antibody capable of binding to the polypeptide, incubating a biological sample with the antibody to allow the formation of an antibody-antigen complex, and determining whether antibody-antigen complex, and determining whether antibody-antigen complex, and determining whether antibody and complex comprises a comprise such as cancer. The antibody to allow the formation of a polypeptide and/or regulating a cell division cycle function. The diseases also include cardiovascular disorders, autoimmune diseases such as also useful in inhibiting the function. The diseases also include cardiovascular disorders, autoimmune diseases such as glomerulonephritatis and rheumatorid arthritis, and dermatological disorders such as such as psoriasis, inflammatory, fungal, and parasitic disorders such as malaria, emphysema and alopecia. The Drosophila sequences were isolated with a plant and include the parasitic disorders were second as the parasitic disorders and alope and alone an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (siRNA). Identification and isolation of the genes was done using RNAI primer targeted to the siRNA sequences. This sequence corresponds to primer used to amplify the Drosophila genes.

Tonegawa S; Karayiorgou M, Miyakawa T,

Diagnosing schizophrenia or susceptibility to schizophrenia comprises detecting a polymorphic variant of a polymorphism in a coding or noncoding portion of a gene encoding a calcineurin (CN) subunit or a CN interacting molecule.

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or detect the sequence or specific
                                                                                                                                                                                                                                                                                                               ö
                                     The invention comprises a method of diagnosing schizophrenia or a susceptibility to schizophrenia. The method involves detecting a polymorphism in a gene encoding a calcineurin (CN) subunit or CN-interacting molecule. The method of the invention is useful for the diagnosis of schizophrenia or a susceptibility to schizophrenia. The present DNA sequence represents a PCR-sequencing primer that was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                               Gaps

ANF is a small peptide hormone synthesised by atrial cardiomyccytes. Infusion of ANF in man causes decreased arterial pressure due to decreased cardiac output and vascular resistance and decreased intravascular volume. Individuals with familial orthostatic intolerance (FOI) develope hypotension and dizziness on standing and may have mitral valve prolapse. Individuals in certain FOI kindreds have pharadoxical increases in ANF levels on standing suggesting possible abnormalities in ANF or its clearance receptors. An intragenic ANF PCRFLE was identified to map ANF and its linkage relationship to FOI was studied. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer, atrial natriuretic factor; ANF; recombination; hormone, atrial, cardiomyocytes; arterial pressure; cardiac output; vascular resistance; intravascular volume; FOI; hypotension; familial orthostatic intolerance; dizziness; mitral valve prolapse; clearance receptor; PCRFLP; linkage relationship; ss.
mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones
                              for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - comprises PCR

The present invention describes a composition comprising a mixture of different species of molecules where each species is linked to a tag that cas under that species and that encodes at least two variable positions on that species, where the tags can be identified without the positions on that species, where the tags can be identification. Liquid phase hybridisation system may be used for simultaneous identification. Liquid phase bybridisation system may be used for simultaneous identification of alsaimlar molecular species. It may also be used to create tagged dissimilar molecular species. It may also be used to create tagged collections that identify any collection of molecular species, e.g. peptides, antibodies, uncleic acids. Method bar codes collections or probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. Or species able to detect small changes or mutations in the target specimen. Or species concentration of the probe would not be limited by the solid support, both the target nucleic acids and the probes can diffuse toward each cother, and signal amplification through cycling reactions could occur. Sequencing DNA with tags in combination with DNA amplification techniques means that there is no need for traditional sequencing methods or the contract of the contract of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tags. The present sequence represents a PCR primer which is used in an

or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the mucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect missense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, The invention discloses a microarray comprising a plurality of nucleic

Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic

WPI; 2003-627388/59.

Claim 6; SEQ ID NO 221; 233pp; English.

Salmo salars Nats, Oreconformis niloticus SNPS of Alianto Habric Alianous SNPS of Aliander Angles and (ii) a mucleic acid having nuclectide sequence that hybridises to (1), or its complement under highly stringent hybridisation conditions. Also described: (1) an isolated oligonucleotide (II) comprising at least 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O. niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites, or their complement; (2) a primer pair (III) suitable for use in PCR, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs and, O. C. or iloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites; and determining (MI) the corigin of fish sample comprising a parentage genotype database comprising a collection of candidate parent genotype of the parentage genotype database, where a match between the sample genotype to the parentage genotype database, where a match between the sample genotype and one of the candidate parent genotype identifies to the sample such as family salmonidae, S. salar, Tilapia, O. niloticus, a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus, controled and centering mucleic acid that hybridises to the contecting the sample comprising SNPs in a sample, which core controled and purcleic acid that hybridises of (II) is useful for useful for catering the sample containing nucleic acide that hybridises to salar sNPs and on niloticus acide that hybridises to salar snPs and onlymorthic useful for detecting nucleic acid molecule comprising a polymorphic sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from 0. niloticus microsatellite, 0. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that bybridises to (II) (III) is useful for detecting nucleic acid that comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention. The present invention describes an isolated nucleic acid (I) comprising single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids trobes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific acid probes is useful in in situ hybridisation, in Southern, Northern or dottor hybridisation to identify or detect the sequence or specific cutations of any gene, in mapping the 5' termini of mRNA molecules by cyntmer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been consolic sold probes incorporated in the microarray. Note: The sequence can data for this patent can also be obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human microarray DNA oligonucleotide SEQ ID NO 101913.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a set of nucleic acids for simultaneous detection of seven most common viruses that cause respiratory infections in human, i.e. human parainfluenza virus (HPIV) 1, 2 and 3, respiratory syncytial virus (RSV), influenza virus (INF) A and B, and adentovirus (ADV). The nucleic acids, probes and primers of the invention are useful for simultaneously detecting seven most common viruses that cause respiratory infections in human. The present sequence is a probe specific for ADV hexon protein (Hex) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New set of nucleic acids, for simultaneously detecting seven most common viruses causing respiratory infections in human, i.e. human parainfluenza virus 1, 2 and 3, respiratory syncytial virus, influenza virus A and B,

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual or monitoring response to treatment in an individual cardiac allograft
                                                                                      17; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Matcuk G, Altman P, Prentice J, Phillips J;

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ00152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                   New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                   Prentice J, Phillips J;

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic select, lung, bone marrow or stem cell transplant rejection, recent mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid archritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or array probe to identify mRNA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

16-MAR-2001; 2001US-0276759P

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 112496; 9pp; English.

Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises the probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dottor probes is useful in in situ hybridisation, in Southern, Northern or dottor probes is useful in in situ hybridisation, in Southern, Northern or dottor primer extensions of any gene, in mapping the 5' termini of mRNA molecules by compared and previously sequenced. The sequence presented is one of the contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of data for this patent can also be obtained in electronic format directly from the microarray contained in electronic format directly from user than an electronic format directly from the format directly from

The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids
                                                                                                                                                                                                                                                                                  diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity

ABN89112 to ABN89130 encoding the human G protein-coupled receptor

(GPCRX) proteins given in ABB81440 to ABB81458. GPCRX proteins can have
antiatheroselerotic, anorectic, antibacterial, fungicide, proteococide,
virucide, analgest, cytostatic, immunomodulator, metabolic, hypotensive,
antiasthmatic, antiparkinsonian, hypertensive, osteopathic, anti-HIV,
antidepressant, antiallergic, nootropic, tranquilliser, neuroleptic,
antidepressant, antiamalor, anticonvulsant, haemostatic, hepatotropic,
immunosuppressive, cerebroprotective, dermatological, antiaddictive,
immunosuppressive, cerebroprotective, dermatological, antiaddictive,
confinity, antiamalor, and polymucleotides can be used for
treating or preventing a GPCRX-associated disorder such as
and gene therapy. GPCRX proteins and polymucleotides can be used for
treating or preventing a GPCRX-associated disorder such as
and polymucleotides can also be used in the manufacture of a medicament
for preventing or treating disorders or syndromes including developmental
diseases, cardiomyopathy, atherosclerosis, cancer, neurodegenerative
diseases, cardiomyopathy, atherosclerosis, cancer, neurodegenerative

ABN89112 to ABN89130 encoding the human G protein-coupled receptor

(GPCRX) proteins given in ABB3140 to ABB31458. GPCRX proteins can have
antiatherosclerotic, anorectic, antibacterial, fungicide, protozoacide,
virucide, analgesic, cytostatic, immunomodulator, metabolic, hypotensive,
antiasthmatic, antiparkinsonian, hypertensive, osteopathic, anti-HIV,
cardiant, antiulier, intinfertility, neuroprotective, antianginal,
cardiant, antiulcer, antiallergic, nootropic, tranquilliser, neuroleptic,
antidepressant, antianlergic, nootropic, tranquilliser, neuroleptic,
cardiant, antimanic, anticonvilsant, haemostatic, hepatotropic,
antidepressant, antimanic, anticonvilsant, antiaddictive,
cardiant, and gracelogical activities, and can be used in vaccines
and gene therapy. GPCRX proteins and polymucleotides can be used for
treating or preventing a GPCRX-associated disorder such as
cardiomyopathy, atherosclerosis, a disorder related to cell signal
processing and metabolic pathway modulation, in a human. GPCRX proteins
and polymucleotides can also be used in the manufacture of a medicament
for preventing or treating disorders or syndromes including developmental
diseases, cardiomyopathy, atherosclerosis, cancer, neurodegenerative
chiscotest autolimmune disorders, infectious diseases and disbetes. ABN89131 to ABN89187 represent PCR primers and probes used in the exemplification of the present invention

Novel isolated G-protein coupled receptor polypeptide, designated NOVX, useful for treating or preventing in human receptor-associated disorders e.g. cardiomyopathy, atherosclerosis or diabetes.

Example 2; Page 247; 264pp; English.

The invention relates to a novel isolated G-protein coupled receptor X (GPCEX) polypeptide. The isolated protein, its encoding polynucleotide and the antibody of the isolated protein is useful for treating or preventing a GPCEX-associated disorder in a subject, preferably human, where the disorder is cardiomyopathy, atherosclerosis or diabetes. The isolated protein, its encoding polynucleotide and the antibody of the isolated protein, its encoding polynucleotide and the antibody of the isolated protein, its encoding polynucleotide and the antibody of the cisolated protein is useful for treating or preventing metabolic disorders, diabetes, obesity, infectious disease, Parkinson's disorder, neurodegenerative disorder, Alzheimer's disease, Parkinson's disorder, immune disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, congenital heart defects, acrtic stenosis, subsortic stenosis, hypertension, congenital heart defects, acrtic stenosis, subsortic stenosis, transplantation, adrenoleukodercopulation, idiopathic thrombocytopenic, prostate cancer, neoplasm, adenocarcinoma, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic cuseful in screening assays, detection assays (e.g., chromosomal mapping, tissue typing, forensic biology). The isolated polynucleotide is useful in gene therapy, to express the isolated protein, to detect GPCKX mRNA or a genetic lesion in a GPCKX gene, and to modulate GPCKX activity. The call of the invention is useful for producing a reverse PCR primer of a GPCKX protein of the invention

This invention relates to a clathrin light chain polypeptide-9.02 and the nuclectide sequence encoding the polypeptide of the invention. The polypeptide may be used to treat diseases such as cancer and HIV infection. The present sequence is that of PCR primer 1b related to the human clathrin light chain polypeptide-9.02 of the invention and used in the sequence is pecification. Note: This sequence, assigned Seq ID 5 in the sequence listing differs from Seq ID 5 in example 5 of the specification are sequence is given in AALS6517
       Human clathrin light chain polypeptide-9.02; cancer; HIV infection; PCR;
                                                                                                                                                                                                                                                                                                                                      Polypeptide-clathrin light chain -9.02 and polynucleotide for coding it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Receptor construct; soluble insulin receptor; IgG; immunoglobulin G; fusion protein; insulin binding protein; growth factor; PCR primer; insulin specific tyrosine kinase; screening; mimetic; ss.

The present invention describes a polypeptide (I), with a molecular described are: (I) a fuelon polypeptide comprising (I) and another polypeptide capable of facilitating expression, purification and/or crystallisation of the polypeptide; (2) a process of producing a polypeptide, where a cell containing a recombinant expression vector comprising a DNA fragment encoding (I), is cultured to promote the expression of (I), (I) being recovered from the culture, and (3) an insulin mimetic which has insulin activity when bound to an insulin receptor in vivo, and which is capable of binding to (I). (I) is used for the screening of ligands binding to the polypeptide, and for screening for insulin mimetics. The insulin mimetics isolated may be oral insulin mimetics which can be formulated into tablets or other oral medicaments. Polypeptides used for the screening of ligands capable of binding to an insulin specific tyrosine kinase. The polypeptide due to its size, may be co-crystallised with insulin making it possible to obtain knowledge of the structure- activity relationship. The present sequence represents a PCR primer used in the construction of receptor constructs, which are expressed as soluble insulin receptor (IR) immunoglobulin G (IgG) fusion proteins, in the exemplification of the present invention Example 1; Page 7; 17pp; English.

Recombinant production of rat thrombomodulin - which promotes thrombin activation of protein C.

Example 3; Page 22; 28pp; Japanese.

This PCR primer was used to amplify DNA encoding rat thrombomodulin (TM) TM upon binding thrombin, promotes thrombin activation of protein C. Host cells transformed with the DNA can be used for the large scale recombinant production of the peptide, or rat thrombomodulin

New isolated binding agents, useful for binding, detecting or identifying a target molecule (e.g. antigen or antigenic epitope), or for detecting or isolating a target in a sample suspected of containing the target.

Example 1; SEQ ID NO 13; 60pp; English.

The invention describes an isolated binding agent comprising a polypeptide: having an amino acid sequence selected from 2 sequences of 134 amino acids (SEQ ID NO: 2 and 4) given in the specification; or having a beta barrel conformation, where the polypeptide comprises a sequence of 134 amino acids (SEQ ID NO: 37) given in the specification.

The described are: an isolated nucleic acid encoding SEQ ID NO: 20 4, and 15, 26, 27, 28 or 29 (sequences not defined in the specification); an expression vector comprising a promoter and a nucleic acid encoding a polypeptide comprising SEQ ID NO: 2, 4 or 37; a library of binding agents where each binding agent in the library of comprises a polypeptide comprising SEQ ID NO: 2 or 37; making a library of binding agent nucleic acids; making a library of binding agent polypeptides; making a library of binding agent polypeptides; making a library of binding agent for generating peptide sequences; and a machineacesible medium. The specifically claimed binding agent comprises a computer implemented method of making a library of binding agent for generating peptide sequences; and a machineacesible medium. The specification. The binding agent comprises a specification. The binding agent can be consulted the binding agent can be consulted to the binding agent can be consulted as a specification. The binding agent can be consulted to the can used to bind, defect or identify a target molecule, such as an antigen or antigenic epitope, to detect or isolate a target in a sample suspected of containing the target, in immunoassays where antibodies are commonly employed. This sequence represents a primer used in the creation of generic binding agent DNA ADQ94810.

RESULT 31
                                                                           The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by Mybridisation to a DNA library, compounds. The mucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific contentions of any gene, in mapping the 5' termini of mRNA molecules by contentions of any gene, in mapping the 5' termini of mRNA molecules by containing segments of DNA that have been to additional subclones containing segments of DNA that have been content for a sequence presented is one of the mucleic acid probes incorporated in the microarray. Note: The sequence containing the contained in electronic format directly from uspro at sequence. The sequence containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the mucleic acid probes incorporated in the microarray. Note: The sequence containing the containing segments of DNA that have been contained to the sequence presented is noted the sequence or specific and probes incorporated in the microarray. Note: The sequence or specific and probes incorporated in the microarray. Note: The sequence or specific and probes incorporated in the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                 EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.
                                                                                                                                                                                                                                                      Human microarray DNA oligonucleotide SEQ ID NO 106308.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 25 BP; 3 A; 8 C; 4 G; 10 T; 0 U; 0 Other;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, an analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, an analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises for a least one or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring can expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a roross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence or specific mutations of any gene, in mapping the 5' termini of mNNA molecules by crimer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing sequence presented is one of the conclain acid probes incorporated in the microarray. Note: The sequence of array of array of array of array of analysis and previously sequenced in the microarray. Note: The sequence of array of array of array of acids the sequence of the sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              data for this patent can also be obtained in electronic format directly from USPTO at segdata.uspto.goc/sequence.html

WPI; 2004-157133/15.

New genetic construct that inhibits expression of the CCRS receptor, useful for preparing vectors for gene therapy of human immune deficiency virus infection and a murine model of immunization.

Example 15; SEQ ID NO 28; 92pp; Spanish.

will a commain which and the formal region of the according as whites), and the construct may additionally encode an anti-CCRS ribozyme in the 3'UTR. The invention also relates to a eukaryotic expression vector or a retroviral vector containing a genetic construct of the invention; a eukaryotic cell transformed with the vector; and an animal model of intracellular immunisation against HIV-1 developed from NOD/Scid mice using the vectors. The genetic constructs of the invention inhibit resistence in individuals where CCRS is inactivated by mutation. The constructs are used to prepare expression or retroviral vectors for the cestablishment of a murine model of intracellular immunisation against HIV to test the effectiveness of the genetic constructs in restricting infection with macrophage-tropic strains of HIV-1. The vectors may also the used in gene therapy of humans who are seropositive for HIV-1, particularly in the early stages of infection, or who have a disease that involves chemokine receptors closely related, structurally and (ADM35869). In addition to a ribozyme, the construct may also encode the chemokine RANTES which is modified to contain an endoplasmic reticulum retention signal (ADM35872) and which is preferably mutated to inactivate its signalling properties. Alternatively, the genetic construct of the invention may encode an N-terminal part of CCR5 (including 2-6 transmembrane domains) with an endoplasmic reticulum retention signal and in which the region corresponding to the extracellular part is replaced with a domain which binds the N-terminal region of CCR5 (such as RANTES), intracellularly, specifically inhibits expression of the human chemokine receptor CRS. The genetic construct may encode a ribozyme directed against the CRS mRNA (ADM3560), or a multicatalytic ribozyme containing several consecutive functional units from one or more ribozymes The invention relates to a genetic construct that, when expressed

The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atheroscierosis, congestive heart failure, systemic lupus erythematosus, atheroscierosis.
functionally, to CCR5. The present sequence represents a PCR primer used to generate DNA encoding a fragment of human RANTES fused to an endoplasmic reticulum retention signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;

The invention relates to a set of nucleic acids for simultaneous detection of seven most common viruses that cause respiratory infections in human, i.e. human parainfluenza virus (HPIV) 1, 2 and 3, respiratory syncytial virus (RSV), influenza virus (IMF) A and B, and adenovirus (ADV). The nucleic acids, probes and primers of the invention are useful for simultaneously detecting seven most common viruses that cause respiratory infections in human. The present sequence is a reverse transcription (RT)-PCR primer used for amplifying ADV hexon protein (Hex)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               viruses causing respiratory infections in human, i.e. human parainfluenza virus 1, 2 and 3, respiratory syncytial virus, influenza virus A and B, and adenovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New set of nucleic acids, for simultaneously detecting seven most common
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to polynucleotides that encode polypeptides involved in biosynthesis of the macrolide antibiotic spiramycin (A), or equivalents within the degeneracy of the genetic code. The polynucleotides and polypeptides are used: (A) to improve production (optionally also purity) of macrolides (M), especially spiramycins; and (b) to produce hybrid antibiotics. The macrolides are useful in human and veterinary medicine as antibiotics, but some are also immunosuppressants (e.g. FK506) useful for treating transplant rejection, rheumatoid anthritis and other autoinmune diseases; or insectiones and anthalmintics (e.g. avermectin). This sequence corresponds to a PCR primer to amplify the spiramycin biosynthetic genes from Streptomyces
                                                                                                                                                                                                                         New polynucleotides encoding proteins involved in spiramycin
biosynthesis, useful for improving synthesis of macrolide antibiotics or
for generating new hybrid macrolides.
                                                                                                    Darbon-Rongere E, Gerbaud C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human calmodulin 9.02 (ABB83796), the polymucleotide (ABN85528) encoding said polypeptide and the method for producing this polypeptide by recombinant DNA technology. The invention also discloses the method for curing several diseases, such as phosphatidylinositol signal pathway dysfunction related diseases by the polypeptide. The invention also discloses an antagonist for resisting the polypeptide and its therapeutic action and the application of polynuclectide coding this novel human calmodulin 9.02. The present sequence is that of a human calmodulin 9.02 PCR primer, useful in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibacterial; immunosuppressive; antirheumatic; antiarthritic;

                        The present invention describes a composition comprising a mixture of different species of molecules where each species is linked to a tag that is unique to that species and that encodes at least two variable positions on that species, where the tags can be identified without the need for first isolating each of the tags prior to identification. Liquid phase hybridisation system may be used for simultaneous identification of a large subset of targets out of a very large collection of similar of dissimilar molecular species. It may also be used to create tagged molecules that identify any collection of molecular species, e.g. molecules that identify any collection of molecular species. For peptides, antibodies, nucleic acids, Method bar codes collections or probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. Use of molecular tags overcomes difficulties of prior art methods, e.g. the concentration of the probe would not be limited by the solid support, both the target nucleic acids and the probes can diffuse toward each other, and signal amplification through cycling reactions could occur. Sequencing that there is no need for traditional sequencing methods or the tags. The present sequence represents a PCR primer which is used in an easily the carrier of the contraction of the materials to be analysed or the tags.

```

The present invention describes a composition comprising a mixture of different species of molecules where each species is linked to a tag that is unique to that species and that encodes at least two variable positions on that species, where the tags can be identified without the

Example 6; Page 94; 138pp; English.

```
phase hybridisation system may be used for simultaneous identification of a large subset of targets out of a very large collection of similar of dissimilar molecular species. It may also be used to create tagged molecules that identify any collection of molecular species, e.g. peptides, antibodies, nucleic acids Method bar codes collections or probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. Use of molecular tags overcomes difficulties of prior art methods, e.g. the concentration of the probe would not be limited by the solid support, other, and signal amplification through cycling reactions could occur. Sequencing DNA with tags in combination with DNA amplification techniques means that there is no need for traditional sequencing methods or attaching to a solid phase, either the materials to be analysed or the tags. The present sequence represents a PCR primer which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          different species of molecules where each species is linked to a tag that is unique to that species and that encodes at least two variable positions on that species, where the tags can be identified without the need for first isolating each of the tags prior to identification. Liquid phase hybridisation system may be used for simultaneous identification of a large subset of targets out of a very large collection of similar of dissimilar molecular species. It may also be used to create tagged molecules that identify any collection of molecular species, e.g. peptides, antibodies, nucleic acids. Method bar codes collections or
need for first isolating each of the tags prior to identification. Liquid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention describes a composition comprising a mixture of

probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. Use of molecular tags overcomes difficulties of prior art methods, e.g. the concentration of the probe would not be limited by the solid support, both the target nuclei acids and the probes can diffuse toward each other, and signal amplification through cycling reactions could occur. Sequencing DNA with tags in combination with DNA amplification techniques means that there is no need for traditional sequencing methods or attaching to a solid phase, either the materials to be analysed or the tags. The present sequence represents a PCR primer which is used in an
                                                                                                                                                                                                                                                                                                                             example from the present invention
